                                                                                                                                                       Run on:
```

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

As in eukaryotes, only Leu and Ser trans are class II thans (large extra arm).

The archaebacterial trans follow general trans patterns, but have certain characteristics so far not reported for other trans all have 'cm' at position 55; "mil' at position 55; "mil' at position 55; "mil' at position 15. Only archaebacterial modify the residue at position 15. Only archaebacterial modify the residue at position 15. Only archaebacterial modify the residue at pastion 15.

Sullenger BA, Rusconi CP; WPI; 2002-479560/51

Novel RNA aptamers that selectively bind coagulation pathway factors, E2F family members, Angl or Ang2, useful for modulating coagulation pathway factor activity, E2F activity and Angl or Ang2 activity in a mammal.

Claim 13; Fig 1A; 216pp; English.

The present invention describes RNA aptamers (I,II,III) that selectively bind: (a) a coagulation pathway factor; (b) an E2F family member; or (c) angiopoietin-1 (Angi) or Ang2, respectively, where (I), (II), (III) have a dissociation constant for the coagulation pathway factor, an E2F family member, or Ang1 or Ang2 of about 20 nM or less. (I) and (III) have cardiant and cyrostatic activities. (I) are useful for modulating the biological activity of a coagulation pathway factor which involves administering (I) to a warm-blooded vertebrate (e.g., a mammal) such that

```
the biological activity of the coagulation pathway factor in the warm-
blooded vertebrate is modulated. (I) are also useful for treating
cardiovascular diseases in the mammal. (II) are useful for modulating EZF
activity in a warm-blooded vertebrate. (III) are useful for modulating
cardiovascular diseases in the mammal. (II) are useful for modulating
cardiovascular diseases in the mammal. (II) are useful for modulating
cardiovasculars and significantly delay the clotting time of normal human
cardiovascular and significantly delay the clotting time of normal human
cardiovascular and completes in response to thrombin. (II) are
cuseful for inhibiting call proliferation in a number of conditions e.g.,
intimal hyperplasia following bypass graft surgery. (III) are useful for
modulating angiogenesis. The RNA aptamers are also useful for diagnostic
research and therapeutic context. The aptamers are useful as diagnostic
research and therapeutic context. The aptamers are useful as diagnostic
research bind, and for isolating and purifying substances to which they
specifically bind, for isolating and purifying substances to which they
bind, and as a separation reagent for retrieving the targets to which
they specifically bind. ABN88488 to ABN88131 and ABB81231 represent

```
The present invention describes RNA aptamers (1,II) that selectively bind: (a) a coagulation pathway factor; (b) an E2F family member; or (c) angiopoietin-1 (Angl) or Ang2, respectively, where (1), (II), (III) have a dissociation constant for the coagulation pathway factor, an E2F family member, or Angl or Ang2 of about 20 mM or less. (1), (II) and (III) have cardiant and cycestatic activities. (1) are useful for modulating the biological activity of a coagulation pathway factor which involves administering (I) to a warm-blooded vertebrate (e.g., a mammal) such that the biological activity of the coagulation pathway factor in the warm-blooded vertebrate (i) are also useful for modulating activity of the mammal. (II) are useful for modulating activity in a warm-blooded vertebrate. (II) are potent anticoagulants and significantly delay the clotting time of normal human coagulants and significantly delay the clotting time of normal human coagulating angiogenesis. The RNA aptamers are also useful for diagnostic research and therapeutic context. The aptamers for conditions e.g., intimal hyperplasia following bypass graft surgery. (III) are useful for intimal hyperplasia following bypass graft surgery. (III) are useful for cessarch and therapeutic context. The aptamers are also useful for diagnostic research and therapeutic context. The aptamers are useful so diagnostic reagents to detect the presence or absence of target substances to which they specifically bind, and for identifying substances to which they specifically bind. Abn8 and Abs131 represent the present the present of the present the present of they specifically bind and as a separation reagent for retrieving the targets to which they appears the detect the present of the present the present of they specifically bind. Abn8 and Abs131 represent the present of they specifically bind and an an appearation reagent for certain the present the present of the

The present invention describes RNA aptamers (I,II,III) that selectively bind: (a) a coagulation pathway factor; (b) an E2F family member; or (c) anajopoietin-I (Angl) or Ang2, respectively, where (I), (II), (III) have a cardiant for the coagulation pathway factor, an E2F family cardiant and cytostatic activities. (I) are useful for modulating the coardiant and cytostatic activities. (I) are useful for modulating the biological activity of a coagulation pathway factor which involves administering (I) to a warm-blooded vertebrate (e.g., a mammal) such that the biological activity of the coagulation pathway factor in the warm-coadiovascular diseases in the mamal. (II) are useful for modulating activity in a warm-blooded vertebrate. (III) are useful for cardiovascular diseases in the mammal. (III) are useful for modulating anticoagulants and significantly delay the clotting time of normal human plasma or the activation of platelets in response to thrombin. (II) are useful for inhibiting cell proliferation in a number of conditions e.g. intimal hyperplasia following bypass graft surgery. (III) are useful for inhibiting cell proliferation in a number of conditions condulating angiogenesis. The RNA aptamers are also useful for diagnostic research and therapeutic context. The aptamers are useful as diagnostic research and therapeutic context. The aptamers are useful as diagnostic research and therapeutic context. The aptamers are useful as diagnostic reagents to detect the presence or absence of target substances to which they specifically bind, and for identifying substances to which they bind, and separation reagent for retrieving the targets to which they bind, and as a separation reagent for retrieving the targets to which they bind, and substance to which they bind, and as a separation reagent for retrieving the targets to which they bind, and substances to which they expecifically bind. The present invention describes RNA aptamers (I,IIII) that selectively bind: (a) a coagulation pathway factor; (b) an E2F family member; or (c) andiopoietin-I (Angl) or Ang2, respectively, where (I), (II) have a andiopoietin-I (Angl) or Ang2, respectively, where (I), (II) have a dissociation constant for the coagulation pathway factor, an E2F family cardiant and cytostatic activities. (I) are useful for modulating the cardiant and cytostatic activities. (I) are useful for modulating the bloodgical activity of a coagulation pathway factor which involves administering (I) to a warm-blooded vertebrate (e.g., a mammal) such that the biological activity of the coagulation pathway factor in the warm-blooded vertebrate (I) are useful for modulating E2F cardiavescular diseases in the mammal. (II) are useful for modulating E2F activity in a warm-blooded vertebrate. (III) are useful for modulating C anticoagulants and significantly delay the clotting time of normal human plasma or the activation of platelets in response to thrombin. (II) are useful for inhibiting cell profiferation in a number of conditions e.g., incimal hyperplasia following bypass graft surgery. (III) are useful for modulating angiogenesis. The RNA aptamers are also useful for diagnostic consecut to detect the presence of targery (III) are useful for which they specifically bind, and for identifying substances to which they complind, and as a separation reagent for retrieving the targets to which they bind, and as a separation reagent for retrieving the targets to which they they specifically bind. ARN8488 to ABN88713 and ABBB3131 represent two sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                              Novel RNA aptamers that selectively bind coagulation pathway factors, E2 family members, Angl or Ang2, useful for modulating coagulation pathway factor activity, E2F activity and Angl or Ang2 activity in a mammal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 96 BP; 30 A; 23 C; 26 G; 0 T; 17 U; 0 Other;

The present invention describes RNA aptamers (I,II,III) that selectively bind: (a) a coagulation pathway factor; (b) an E2F family member; or (c) bind: (a) a coagulation pathway factor; (b) an E2F family member; or Angl or Ang2, respectively, where (I), (II), (III) have a dissociation constant for the coagulation pathway factor, an E2F family cardinistering of crosquiation pathway factor, and (III) have biological activity of a coagulation pathway factor which involves administering (I) to a warm-blooded vertebrate (e.g., a mammal) such that the biological activity of the coagulation pathway factor in the warm-coagular diseases in the mammal. (II) are useful for modulating E2F cardiovascular diseases in the mammal. (II) are useful for modulating E2F activity in a warm-blooded vertebrate. (III) are useful for modulating E2F activity in a warm-blooded vertebrate. (III) are useful for modulating anticoagulants and significantly delay the clotting time of normal human plasma or the activation of platelets in response to thrombin. (II) are useful for inhibiting cell profiferation in a number of conditions e.g., intimal hyperplasia following bypass graft surgery. (III) are useful for diagnostic, cosecut and therapeutic context. The aptamers are useful as diagnostic, research and therapeutic context. The aptamers are useful as diagnostic, creagents to detect the presence or absence of target substances to which they specifically bind, and for identifying substances to which they bind, and as a separation reagent for schrieving the targets to which they be specifically bind. The present invention describes RNA aptamers (1,II,III) that selectively bind: (a) a coagulation pathway factor; (b) an E2F family member; or (c) andiopoietin-I (Angl) or Ang2, respectively, where (I), (II), (III) have a dissociation constant for the coagulation pathway factor, an E2F family cardiant and cytostatic activities. (I) are useful for modulating the biological activity of a coagulation pathway factor which involves administering (I) to a warm-blooded vertebrate (e.g., a mammal) such that the biological activity of the coagulation pathway factor in the warm-blooded vertebrate (e.g., a mammal) such that cardiovascular diseases in the mammal. (II) are useful for modulating cardiovascular diseases in the mammal. (II) are useful for modulating Angl or Ang2 activity in a warm-blooded vertebrate. (II) are useful for modulating anticoagulants and significantly delay the clotting time of normal human cuseful for inhibiting cardiorness. The RNA aptamers are also useful for diagnostic infinal hyperplasia following bypass graft surgery. (III) are useful for casearch and therapeutic context. The aptamers are also useful for diagnostic research and therapeutic context. The aptamers are useful for diagnostic research and therapeutic context. The aptamers are useful for modulating anglesis in the NNA aptamers are also useful for diagnostic research and therapeutic context. The aptamers are useful for diagnostic research and therapeutic context. The aptamers are useful for diagnostic research and therapeutic for isolating and purifying substances to which they specifically bind, and for identifying substances to which they specifically bind. ABN881818 and ABBS121 represent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         E2F
RNA aptamer, identification, coagulation factor, angiopoietin, thrombin, E2F family, cardiant, cytostatic, cardiovascular disease, anticoagulant, cell proliferation, intimal hyperplasia, angiogenesis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel RNA aptamers that selectively bind coagulation pathway factors, Ez family members, Angl or Ang2, useful for modulating coagulation pathway factor activity, E2F activity and Angl or Ang2 activity in a mammal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 95 BP; 24 A; 25 C; 29 G; 0 T; 17 U; 0 Other;

Claim 13; Fig 1A; 216pp; English.

```
The present invention describes RNA aptamers (I,II,III) that selectively bind: (a) a coagulation pathway factor; (b) an E2F family member; or (c) angiopoletin-I (Angi) or Angi, respectively, where (I), (II), (III) have a dissociation constant for the coagulation pathway factor, an E2F family member, or Angi or Angi of about 20 nM or less. (i), (II) and (III) have cardiant and cytostatic activities. (I) are useful for modulating the biological activity of a coagulation pathway factor which involves administering (I) to a warm-blooded vertebrate (e.g., a mammal) such that the blooded vertebrate is modulated. (I) are also useful for recting cardiovascular diseases in the mammal. (II) are useful for modulating E2F cardiovascular diseases in the mammal. (II) are useful for modulating and significantly delay the clotting time of normal human cartivity in a warm-blooded vertebrate. (II) are useful for modulating and significantly delay the clotting time of normal human coagulation of platelets in response to thrombin. (II) are useful for intibiting cell proliferation in a number of conditions e.g. intimal hyperplasia following bypass graft surgery. (III) are useful for condulating angiogenesis. The RNA aptamers are also useful for diagnostic research and therapeutic context. The aptamers are useful for diagnostic research and therapeutic context. The aptamers are useful for diagnostic research and therapeutic senter. The aptamers are useful as diagnostic research and a separation reagen for identifying substances to which they specifically bind, and for identifying substances to which they specifically bind. The present invention describes RNA aptamers (I,II,III) that selectively bind: (a) a coagulation pathway factor; (b) an E2F family member; or (c) andiopoletin-1 (Angl) or Ang2, respectively, where (I), (II), (III) have a dissociation constant for the coagulation pathway factor, an E2F family cardiant and cytostatic activities. (I) are useful for modulating the coadulation pathway factor which involves biological activity of a coagulation pathway factor which involves administering (I) to a warm-blooded vertebrate (e.g., a mammal) such that the biological activity of the coagulation pathway factor in the warm-coadiovascular diseases in the mammal. (II) are useful for modulating E2F activity in a warm-blooded vertebrate. (II) are useful for modulating Angl or Ang2 activity in a warm-blooded vertebrate. (III) are useful for modulating anticoagulants and significantly delay the clotting time of normal human coagulating eactivity in a warm-blooded vertebrate. (II) are potent continual hyperplasia following bypass graft surgery. (III) are useful for inhibiting englosomers are also useful for diagnostic research and therapeutic context. The aptamers are useful for diagnostic research and therapeutic context. The aptamers are useful as diagnostic research and therapeutic context. The aptamers are useful as diagnostic research and therapeutic context. The aptamers are useful as diagnostic research and therapeutic context. The aptamers are useful for diagnostic research and therapeutic context. The aptamers are useful as diagnostic research and therapeutic for research and therapeutic context. The aptamers are useful as diagnostic research and therapeutic for research and therapeutic context. The aptamers are useful for diagnostic research and therapeutic context. The aptamers are useful as diagnostic creagents to detect the presence or absence of targery substances to which they specifically bind, and for identifying substances to which they they appear the processed to a separation reagent for research and the a separa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel RNA aptamers that selectively bind coagulation pathway factors, E2F family members, Angl or Ang2, useful for modulating coagulation pathway factor activity, E2F activity and Angl or Ang2 activity in a mammal.
                                                                                                                                                                                                                                                   RNA aptamer; identification; coagulation factor; angiopoietin; thrombin; E2F family; cardiant; cytostatic; cardiovascular disease; anticoagulant; cell proliferation; intimal hyperplasia; angiogenesis;

RNA aptamer; identification; coagulation factor; angiopoietin; thrombin; E2F family; cardiant; cytostatic; cardiovascular disease; anticoagulant; cell proliferation; intimal hyperplasia; angiogenesis;
Novel RNA aptamers that selectively bind coagulation pathway factors, E2 family members, Angl or Ang2, useful for modulating coagulation pathway factor activity, E2F activity and Angl or Ang2 activity in a mammal.
                                                                                                                      Coagulation factor IXa binding/inhibiting RNA aptamer SEQ ID NO:15.

The present invention describes RNA aptamers (I,II,III) that selectively bind: (a) a coagulation pathway factor; (b) an E2F family member; or (c) angiopoletin-1 (Angi) or Angi, respectively, where (i), (II), (III) have a dissociation constant for the coagulation pathway factor, an E2F family member, or Angl or Ang2 of about 20 nM or less. (i), (II) and (III) have cardiant and expostatio activities. (I) are useful for modularing the biological activity of a coagulation pathway factor which involves administering (I) to a warm-blooded vertebrate (e.g., a mammal) such that the biological activity of the coagulation pathway factor in the warm-blooded vertebrate. (II) are useful for modulating cardiovascular diseases in the mammal. (II) are useful for modulating activity in a warm-blooded vertebrate. (II) are potent anticoagulants and significantly delay the clotting time of normal human anticoagulants and significantly delay the clotting time of normal human carticoagulants and significantly delay the clotting time of normal human anticoagulants and significantly delay the clotting time of normal human carticoagulants and significantly delay the clotting time of normal human anticoagulants and significantly delay the clotting time of normal human human the activation of platelets in response to thrombin. (II) are useful for inhibiting cell proliferation in a number of conditions e.g., intimal hyperplasia following bypeas graft surgery. (III) are useful for inhibiting cell proliferation are also useful for diagnostic research and therapeutic context. The aptamers are useful as diagnostic research and therapeutic context. The aptamers are useful as diagnostic research and therapeutic context. The aptamers are useful as diagnostic research and therapeutic context. The aptamers are useful as diagnostic research and therapeutic context. The aptamers are useful as diagnostic research and therapeutic context abstances to which they they they are defected the presence or absence of target substances to which they

The present invention describes RNA aptamers (I,II,III) that selectively bind: (a) a coagulation pathway factor; (b) an E2F family member; or (C) angiopoietin-I (Angi) or Angi, respectively, where (I), (II) have a dissociation constant for the coagulation pathway factor, an E2F family member, or Angi or Angi of about 20 nM or less (I), (II) and (III) have cardiant and cytostatic activities. (I) are useful for modulating the biological activity of a coagulation pathway factor which involves administering (I) to a warm-blooded vertebrate (e.g., a mammal) such that biological activity of the coagulation pathway factor in the warm-blooded vertebrate is modulated. (I) are also useful for modulating activity in a warm-blooded vertebrate. (III) are useful for modulating activity in a warm-blooded vertebrate. (III) are useful for modulating activity in a warm-blooded vertebrate. (III) are useful for modulating angisticantly delay the clotting time of normal human plasma or the activation of platelets in response to thrombin. (II) are
                                                                                                                                                                                        ö

useful for inhibiting cell proliferation in a number of conditions e.g., and lintimal hyperplasia following bypass graft surgery. (III) are useful for modulating angiogenesis. The RNA aptamers are also useful for diagnostic research and therapeutic context. The aptamers are useful as diagnostic reagents to detect the presence or absence of target substances to which they specifically bind, and for identifying substances to which they specifically bind, for isolating and purifying substances to which they bind, and as a separation reagent for retrieving the targets to which they specifically bind. ABN88488 to ABN88713 and ABB81231 represent sequences used in the exemplification of the present invention

Novel RNA aptamers that selectively bind coagulation pathway factors, Ez family members, Angl or Ang2, useful for modulating coagulation pathway factor activity, E2F activity and Ang1 or Ang2 activity in a mammal.

The present invention describes RNA aptamers (I,II,III) that selectively bind: (a) a coagulation pathway factor; (b) an E2F family member; or (c) angiopoletin-1 (Angl) or Ang2, respectively, where (I), (II), (III) have a dissociation constant for the coagulation pathway factor, an E2F family member, or Ang1 or Ang2 of about 20 nM or less. (I), (II) and (III) have cardiant and cytostatic activities. (I) are useful for modulating the biological activity of a coagulation pathway factor which involves administering (I) to a warm-looded extebrate (e.g., a mammal) such that the biological activity of the coagulation pathway factor in the warm-

```
cardiovascular diseases in the mammal. [II] are useful for modulating E2F activity in a warm-blooded vertebrate. [III] are useful for modulating E2F activity in a warm-blooded vertebrate. [III] are useful for modulating and so trivity in a warm-blooded vertebrate. [III] are useful for modulating canticoagulants and significantly delay the clotting time of normal human plasma or the activation of platelets in response to thrombin. [II] are useful for inhibiting cell profiferation in a number of conditions e.g., intimal hyperplasia following bypass graft surgery. [III] are useful for modulating angiogenesis. The RNA aptamers are also useful for diagnostic research and therapeutic context. The aptamers are useful as diagnostic research and therapeutic context. The aptamers are useful as diagnostic research and therapeutic context. The aptamers are useful as diagnostic research and therapeutic context. The aptamers are useful as diagnostic for seperifically bind, and for identifying substances to which they specifically bind. Abs08448 to Abs08413 and Abs084231 represent chey specifically bind. member, or Angl or Angl of about 20 nM or less. (1), (II) and (III) have cardiant and cytostatic activities. (1) are useful for modulating the biological activity of a coagulation pathway factor which involves administering (1) to a warm-blooded vertebrate (e.g., a mammal) such that bloological activity of the coagulation pathway factor in the warm-blooded vertebrate is modulated. (1) are also useful for modulating EZF activity in a warm-blooded vertebrate. (III) are useful for modulating activity in a warm-blooded vertebrate. (III) are useful for modulating activity in a warm-blooded vertebrate. (III) are useful for modulating activity in a warm-blooded vertebrate. (III) are useful for modulating anticoagulants and significantly delay the clotting time of normal human plasma or the activation of platelets in response to thrombin. (II) are useful for intimal hyperplasia following bypass graft surgery. (III) are useful for modulating and horspectifically bypass graft surgers are useful for diagnostic research and therapeutic context. The aptamers are useful as diagnostic reagents to detect the presence or absence of target substances to which they specifically bind, for isolating and purifying substances to which they specifically bind. AbbN88488 to AbbN88113 and AbbN88113 represent they specifically bind. AbbN88488 to AbbN88113 and present invention
      coagulation pathway factor, an E2F family

Novel RNA aptamers that selectively bind coagulation pathway factors, E2 family members, Angl or Ang2, useful for modulating coagulation pathway factor activity, E2F activity and Ang1 or Ang2 activity in a mammal.

```
The present invention describes RNA aptamers (I,II,III) that selectively bind: (a) a coagulation pathway factor; (b) an E2F family member; or (c) angiopoletin-1 (Angi) or Angi, respectively, where (I), (II), (III) have a angiopoletin-1 (Angi) or Angi, respectively, where (I), (II) and (III) have cardiant and cytostatic activities. (I) are useful for modulating the biological activity of a coagulation pathway factor which involves administering (I) to a warm-blooded vertebrate (e.g., a mammal) such that the biological activity of the coagulation pathway factor in the warm-blooded vertebrate is modulated. (I) are useful for modulating E2F cardiovascular diseases in the mammal. (II) are useful for modulating activity in a warm-blooded vertebrate. (III) are useful for modulating activity in a warm-blooded vertebrate. (III) are useful for modulating anticoagulants and significantly delay the clotting time of normal human plasma or the activation of platelets in response to thrombin. (II) are useful for inhibiting cell proliferation in a number of conditions e.g., intimal hyperplasia following bypass graft surgery. (III) are useful for inhibiting cell proliferation in a number of conditions e.g., intimal hyperplasia following bypass graft surgery. (III) are useful for research and therapeutic context. The aptamers are also useful for descrit the presence or absence of target substances to which they specifically bind, and for identifying substances to which they bind, and as a separation reagent for retrieving the targets to which they bind, and as a separation of the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        IndelB
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 4, Application US/08512861A
Patent No. 6146886
GENERAL INFORMATION:
APPLICANT: James D. Thompson
TITLE OF INVENTION: IMPROVED RNA POLYMERASE III-BASED
TITLE OF INVENTION: EXPRESSION OF THERAPEUTIC RNAS
NUMBER OF SEQUENCES: 25
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                             APPLICANT: James D. Thompson

Batent No. 6346385

GENERAL INFORMATION:
TITLE OF INTERTION: Analysis of predisposition based on human airway
TITLE OF INVENTION: tripsin protease gene polymorphism
TITLE OF INVENTION: tripsin protease gene polymorphism
TITLE REPERENCE: 059572

CURRENT APPLICATION NUMBER: US/09/581,617

CURRENT FILING DATE: 2000-06-15

PRIOR PELING DATE: 1998-12-16

PRIOR FILING DATE: 1998-12-16

PRIOR FILING DATE: 1999-12-16
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

TELEPAK: (508) 927-1705
INFORMATION FOR SEQ ID NO: 4:
SEQUENCE CHARACTERISTICS:
LENGTH: 180 base pairs
TYPE: nucleic acid
STANDEDNESS: single
30901
  REGISTRATION NUMBER:
```

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                        /lab host="E. Coli strain XL10-Gold, T1-resistant, F-"
/clone_llb="Mouse 10kb plasmid UUGCIM library"
/clone_llb="Wouse 10kb plasmid UUGCIM library"
/note="Vector: PWD42nv; Purified genomic DNA from M.
musculus C57BL/6J (male) was obtained from the Jackson
Laboratory Mouse DNA Resources/documents/dnares/). The DNA
was blut cand-repaired by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polymucleotide kinase. Adaptor oligonucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pWD42 (gil 4732114 gb) AR129072.1), a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. coli XII0-Gold (Stratagene) cells
and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CE086809 17000359035311 Dog Library Canis familiaris genomic,

Direct Submission
Submitted (15-DEC-2003) Weisshaar B., Max-Planck-Institut fuer
Zuechtungsforschung, Carl-von-Linne-Weg 10, Koeln, 50829, Germany
This sequence is recovered from the left border of the T-DNA. It
indicates an insertion close to or within gene Atlg06940. The
sequences are generated at the MPI for Plant Breeding Research in
the context of the GABI-Kat project. GABI-Kat is part of the German
Plant Genomics program designated 'GABI'. Information on line
availability can be found at:

Clones are derived from the mouse BAC library RPCI-23. For BAC

Library availability, please contact Pieter de Jong

(pieter@dejong.med.buffalo.edu). Clones may be purchased from BACPAC Resources (http://bacpac.med.buffalo.edu/orderingframe.htm)

or from Resea of Genetics (info@resgen.com). BAC end page:

/note="Vector: PWD42nry; Purified genomic DNA from M.
musculus C57BL/6J (male) was obtained from the Jackson
Laboratory Mouse DNA Resources/documents/dhares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polymuclectide kinase. Adaptor oligonuclectides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pWD402 (gil 4732114 gb AR129072.1), a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
                                                                                                                                                                                                                                                                                                                                                                                   SM Mus musculus
